AGENTIC AI ON AWS

March 31, 2026

5:30 PM-9:00 PM

Pacific Time

Agentic AI introduces a new class of autonomous systems capable of reasoning, acting, and executing with minimal human intervention. The question for today's leaders is no longer whether the technology works, but how it can be applied responsibly within real business, data, and governance constraints.

This private executive engagement will bring together senior technology leaders for an open, peer-driven conversation on the practical realities of adopting Agentic AI on AWS. Mission, a CDW company, experts will share firsthand perspectives from organizations actively building and operating advanced AI systems, while attendees exchange experiences around evaluating frameworks, securing data pipelines, and measuring enterprise impact.

Over a curated reflection, the discussion will focus on cutting through the hype to examine current platform capabilities, implementation lessons, and the strategic considerations required to translate autonomous AI into scalable, secure, and measurable business value.
