UNDERSTANDING SASE FRAMEWORK

April 28, 2022

3:00 PM-4:15 PM

Eastern Time

The main goal of the SASE framework is to help modernize networks and security to keep up with the ever-evolving business requirements. In doing so, SASE provides unified security across users, wherever they do business, and provides visibility and control over what can be accessed. Secure access to services needs to be everywhere, not just at the datacenter. This is where Secure Access Service Edge (SASE) comes in by providing visibility and control over what can be accessed. The ultimate goal, at the high level, for businesses who wish to adopt SASE is leveraging cloud-centric technologies to reduce operational burdens and costs, therefore reducing threats to the organizations. Ransomware & Extortionware Supply chain technology Zero trust network access Cloud security 3rd party contractor access & risk mitigation
